Abstract

This paper presents to find the shortest path in a directed graph which an intuitionistic fuzzy number, instead of a fuzzy number is assigned to each arc length. An existing algorithm is modified to find the optimal path. Inputs and outputs of the proposed algorithm are intuitionistic fuzzy numbers. Finally an illustrative numerical example is given to demonstrate the proposed approach.

Mathematics Subject Classification: 03E72, 03F55

Keywords: Intuitionistic Fuzzy Set (IFS), Intuitionistic Fuzzy Shortest Path, Intuitionistic Fuzzy Number (IFN)

1. Introduction

The shortest path problem is the basic network problem, the real number is assigned to each edges. The Fuzzy shortest path problem was first analyzed by Dubois and Prade[2] using fuzzy number instead of a real number is assigned to each edges. In this paper we propose an intuitionistic fuzzy number instead of fuzzy number. An algorithm is based on the idea that from all the shortest paths from source node to destination node, an edge with shortest length is computed and the Euclidean distance is computed for all the paths with the edge of
minimum distance is the shortest path for membership and non membership values. This paper is organized as follows: In section 2 provides preliminary concepts required for analysis. In section 3, an intuitionistic fuzzy shortest path length procedure is given. In section 4 and 5 intuitionistic fuzzy shortest path problem is explained using an illustrative example.

2. Preliminary and definitions

The concepts of an intuitionistic fuzzy set was introduced by Atanassov[1] to deal with vagueness, which can be defined as follows.

2.1 Intuitionistic Fuzzy Set
Let X be an universe of discourse, then an Intuitionistic Fuzzy Set (IFS) A in X is given by $A = \{ (x, \mu_A(x), \gamma_A(x)) \mid x \in X \}$ where the functions $\mu_A(x) : X \rightarrow [0,1]$ and $\gamma_A(x) : X \rightarrow [0,1]$ determine the degree of membership and non membership of the element $x \in X$, respectively and for every $x \in X$, $0 \leq \mu_A(x) + \gamma_A(x) \leq 1$.

2.2 Intuitionistic Fuzzy Graph
Let $X$ be an universe, containing fixed graph vertices and let $V \subset X$ be a fixed set. Construct the IFS $V = \{ (x, \mu_v(x), \gamma_v(x)) \mid x \in X \}$ where the functions $\mu_v(x):X\rightarrow[0,1]$ and $\gamma_v(x):X\rightarrow[0,1]$ determine the degree of membership and non membership to set $V$ of the element (vertex) $x\in X$, respectively and for every $x \in X$, $0 \leq \mu_v(x) + \gamma_v(x) \leq 1$.

2.3 Intuitionistic Fuzzy Number [7]
Let $A = \{ (x, \mu_A(x), \gamma_A(x)) \mid x \in X \}$ be an IFS, then we call the pair $(\mu_A(x), \gamma_A(x))$ an intuitionistic fuzzy number. For convenience, we denote an intuitionistic fuzzy number by $(a,b,c), (l,m,n)$. Where $(a,b,c) \in F(I)$, $(l,m,n) \in F(I)$, $I = [0,1]$, $0 \leq c + n \leq 1$.

2.4 Triangular Intuitionistic Fuzzy Number and its Arithmetic [4]
A triangular intuitionistic fuzzy number $A$ is denoted by $A = \{ (\mu_A, \gamma_A) \mid x \in R \}$, where $\mu_A$ and $\gamma_A$ are triangular fuzzy numbers with $\gamma_A \leq \mu_A$. So a triangular intuitionistic fuzzy number $A$ is given by $A = (a,b,c), (e,f,g)$ with $(e,f,g) \leq (a,b,c)$ i.e., either $e \geq b$ and $f \geq c$ or $f \leq a$ and $g \leq b$ are membership and non membership fuzzy numbers of $A$. An intuitionistic fuzzy number $(a,b,c), (e,f,g)$ with $e \geq b$ and $f \geq c$ is shown in the following figure.
On searching intuitionistic fuzzy shortest path in a network

The addition of two triangular intuitionistic fuzzy numbers are as follows [5]
For two Triangular Intuitionistic Fuzzy Numbers $A = \{a, b, c\}, \{e, f, g\}$ and $B = \{a_2, b_2, c_2\}, \{e_2, f_2, g_2\}$ with $\mu_A \neq \mu_B$ and $\gamma_A \neq \gamma_B$, define $A + B = \{a_1 + a_2, b_1 + b_2, c_1 + c_2\}, \{e_1 + e_2, f_1 + f_2, g_1 + g_2\}$:

3. An Intuitionistic Fuzzy Shortest Path Length Procedure

In this paper the arc length in a network is considered to be an intuitionistic fuzzy number, namely triangular intuitionistic fuzzy number. The shortest path length procedure is based on the Chuang and Kung [6] method.

Step 1 Compute all the possible path lengths $L_i$ from $i = 1, 2, 3, \ldots, n$. Where $L_i = \{\{a_i, b_i, c_i\}, \{l_i, m_i, n_i\}\}$

Step 2 Initialize $L_{\text{min}} = \{\{a, b, c\}, \{l, m, n\}\} = L_1 = \{\{a_1, b_1, c_1\}, \{l_1, m_1, n_1\}\}$

Step 3 Initialize $i = 2$

Step 4 (a) Compute $\{a, b, c\}$ for membership values

$$b = \begin{cases} \bar{b}_i, & \text{if } b \leq a_i^i \\ \frac{bb_i - aa_i^i}{(b + b_i) - (a + a_i^i)}, & \text{if } b > a_i^i \end{cases}$$

$$a = \text{Min}(a, a_i^i)$$

$$c = \text{Min}(c, b_i)$$

Step 4 (b) Compute $\{l, m, n\}$ for non membership values

\[
m = \begin{cases} 
m, & \text{if } m \leq l_i' \\
\frac{mm_i' - ll_i'}{(m + m_i') - (l + l_i')}, & \text{if } m > l_i'
\end{cases}
\]

\[l = \text{Min}(l, l_i')
\]
\[n = \text{Min}(n, m_i')
\]

Step 5 Set \(L_{Min} = (\langle a, b, c \rangle, \langle l, m, n \rangle)\) as calculated in step – 4
Step 6 \(i = i + 1\)
Step 7 if \(i < n+1\), go to Step – 4

4. Numerical Example

In order to illustrate the above procedure consider a small network shown in figure, where each arc length is represented as a triangular intuitionistic fuzzy number.

\[\begin{align*}
\text{Step 1} & \quad \text{In the above network there are four possible paths (n = 4) from Source node 1 to destination node 6. The possible paths are as follows:} \\
& \quad \text{Path (1): 1} \rightarrow 2 \rightarrow 5 \rightarrow 6 \quad L_1 = \langle \langle 67,105,138 \rangle, \langle 126,157,178 \rangle \rangle \\
& \quad \text{Path (2): 1} \rightarrow 3 \rightarrow 4 \rightarrow 6 \quad L_2 = \langle \langle 53,92,125 \rangle, \langle 103,134,147 \rangle \rangle \\
& \quad \text{Path (3): 1} \rightarrow 2 \rightarrow 4 \rightarrow 6 \quad L_3 = \langle \langle 64,90,119 \rangle, \langle 103,136,157 \rangle \rangle \\
& \quad \text{Path (4): 1} \rightarrow 3 \rightarrow 5 \rightarrow 6 \quad L_4 = \langle \langle 56,82,118 \rangle, \langle 98,128,148 \rangle \rangle \\
\end{align*}\]

\[\begin{align*}
\text{Step 2} & \quad \text{Initialize:} \\
L_{Min} &= \langle \langle a, b, c \rangle, \langle l, m, n \rangle \rangle = L_1 = \langle \langle a_1, b'_1, c'_1 \rangle, \langle l'_1, m'_1, n'_1 \rangle \rangle = \langle \langle 67,105,138 \rangle, \langle 126,157,178 \rangle \rangle \\
\text{Step 3} & \quad \text{Initialize: } i = 2
\end{align*}\]
Step 4 (a) Compute $\{a, b, c\}$ for membership values

\[
\text{if } b > a_2' \text{ then } b = \frac{bb_2' - aa_2'}{(b+b_2')-(a+a_2')} = \frac{105 \times 92 - 67 \times 53}{(105 + 92) - (67 + 53)} = 79.34
\]

$a = \text{Min}(a, a_2') = \text{Min}(67, 53) = 53$

$c = \text{Min}(c, b_2') = \text{Min}(138, 92) = 92$

Step 4 (b) Compute $\{l, m, n\}$ for non membership values

\[
\text{if } m > l_2' \text{ then } m = \frac{mm_2' - ll_2'}{(m+m_2')-(l+l_2')} = \frac{157 \times 134 - 126 \times 105}{(157 + 134) - (126 + 105)} = 130.13
\]

$l = \text{Min}(l, l_2') = \text{Min}(126, 105) = 105$

$n = \text{Min}(n, m_2') = \text{Min}(178, 134) = 134$

Step 5 Set $L_{\text{Min}} = \{(53, 79.34, 92), (105, 130.13, 134)\}$ as calculated in step – 4

Step 6 $i = i + 1 = 3$

Step 7 if $i < n+1(=5)$, go to Step – 4

Step 4 (a) Compute $\{a, b, c\}$ for membership values

\[
\text{if } b > a_3' \text{ then } b = \frac{bb_3' - aa_3'}{(b+b_3')-(a+a_3')} = \frac{79.34 \times 90 - 53 \times 64}{(79.34 + 90) - (53 + 64)} = 71.62
\]

$a = \text{Min}(a, a_3') = \text{Min}(53, 64) = 53$

$c = \text{Min}(c, b_3') = \text{Min}(92, 90) = 11$

Step 4 (b) Compute $\{l, m, n\}$ for non membership values

\[
\text{if } m > l_3' \text{ then } m = \frac{mm_3' - ll_3'}{(m+m_3')-(l+l_3')} = \frac{130.13 \times 136 - 105 \times 103}{(130.13 + 136) - (105 + 103)} = 118.4
\]

$l = \text{Min}(l, l_3') = \text{Min}(105, 103) = 103$

$n = \text{Min}(n, m_3') = \text{Min}(134, 136) = 134$

Step 5 Set $L_{\text{Min}} = \{(53, 71.62, 90), (103, 118.4, 134)\}$ as calculated in step – 4

Step 6 $i = i + 1 = 4$

Step 7 if $i < n+1(=5)$, go to Step – 4

Step 4 (a) Compute $\{a, b, c\}$ for membership values

\[
\text{if } b > a_4' \text{ then } b = \frac{bb_4' - aa_4'}{(b+b_4')-(a+a_4')} = \frac{71.62 \times 82 - 53 \times 56}{(71.62 + 82) - (53 + 56)} = 65.1
\]

$a = \text{Min}(a, a_4') = \text{Min}(53, 56) = 53$

$c = \text{Min}(c, b_4') = \text{Min}(90, 82) = 82$

Step 4 (b) Compute $\{l, m, n\}$ for non membership values
if \( m > l_i \) then \( m = \frac{m_i - l_i}{(m + m_i) - (l + l_i)} = \frac{118.4 \times 128 - 103 \times 98}{(118.4 + 128) - (103 + 98)} = 111.48 \)

\( l = \text{Min}(l, l_i) = \text{Min}(103, 98) = 98 \)

\( n = \text{Min}(n, m_i) = \text{Min}(164, 128) = 128 \)

Step 5 Set \( L_{\text{Min}} = \langle 53, 65.1, 82, 98, 111.48, 128 \rangle \) as calculated in step – 4

Step 6 \( i = i + l = 5 \)

Step 7 if \( i \geq n + l(=5) \), Stop the procedure

Finally we get an Intuitionistic Shortest Path Length \( L_{\text{Min}} = \langle 53, 65.1, 82, 98, 111.48, 128 \rangle \)

5. An Algorithm for Searching the Shortest Path

We aim at determining an intuitionistic fuzzy shortest path length \( L_{\text{Min}} \) and the shortest needed to traverse from source to destination. By combining an intuitionistic fuzzy shortest length method with similarity measure, an algorithm is as follows. An Algorithm for intuitionistic fuzzy shortest path [3]

Step 1 Find out all the possible paths from source node \( s \) to destination node \( d \) and compute the corresponding path lengths \( L_i, i = 1, 2, 3, \ldots, n \).

Step 2 Compute \( L_{\text{Min}} \) by using an intuitionistic fuzzy shortest path length procedure

Step 3 Find the Euclidean distance \( d_i \) for \( i=1,2,3,\ldots,n \) between all the possible path and \( L_{\text{Min}} \).

Step 4 Decide the shortest path with the path having lowest Euclidean distance.

On executing the above algorithm on the example network of figure 2. The first two steps have been already calculated in section – 4.

The next step, we compute the similarity degree \( S(L_{\text{Min}}, L_i) \) between \( L_{\text{Min}} \) and \( L_i \) for \( i=1,2,3,\ldots,n \) by means of similarity measure

\[
S(A, B) = \frac{m}{\sum_{i=1}^{m} \left| A(x_i) - B(x_i) \right|}
\]

In order to compute the accuracy in similarity degree, we should let a generic element \( U \) denoted by \( \mu(i = 1, 2, 3, \ldots, n) \).

Step 1: From Section – 4 we have four possible paths lengths in Figure – 2 as

Path (1): \( 1 \rightarrow 2 \rightarrow 5 \rightarrow 6 \) \( L_1 = \langle 67, 105, 138 \rangle, \langle 126, 157, 178 \rangle \)

Path (2): \( 1 \rightarrow 3 \rightarrow 4 \rightarrow 6 \) \( L_2 = \langle 53, 92, 125 \rangle, \langle 105, 134, 147 \rangle \)

Path (3): \( 1 \rightarrow 2 \rightarrow 4 \rightarrow 6 \) \( L_3 = \langle 64, 90, 119 \rangle, \langle 103, 136, 157 \rangle \)

Path (4): \( 1 \rightarrow 3 \rightarrow 5 \rightarrow 6 \) \( L_4 = \langle 56, 82, 118 \rangle, \langle 98, 128, 148 \rangle \)

Step 2: From Section – 4 we have calculated minimum path length is
On searching intuitionistic fuzzy shortest path in a network

$L_{\text{Min}} = (\langle 53, 65.1, 82 \rangle, \langle 98, 111.48, 128 \rangle)$

Step 3: Euclidean distance between all path lengths $P_i \ (i=1,2,3,4)$ and $L_{\text{Min}}$

\[
d(p_i, L_{\text{Min}}) = \left(\sqrt{(67-53)^2 + (105-65.1)^2 + (138-82)^2}, \sqrt{(126-98)^2 + (157-111.48)^2 + (178-128)^2}\right)
\]
\[= (\langle 70.17, 73.18 \rangle)
\]

\[
d(p_i, L_{\text{Min}}) = \left(\sqrt{(53-53)^2 + (92-65.1)^2 + (125-82)^2}, \sqrt{(105-98)^2 + (134-111.48)^2 + (147-128)^2}\right)
\]
\[= (\langle 50.72, 30.28 \rangle)
\]

\[
d(p_i, L_{\text{Min}}) = \left(\sqrt{(64-53)^2 + (90-65.1)^2 + (119-82)^2}, \sqrt{(103-98)^2 + (136-111.48)^2 + (157-128)^2}\right)
\]
\[= (\langle 45.93, 38.3 \rangle)
\]

\[
d(p_i, L_{\text{Min}}) = \left(\sqrt{(56-53)^2 + (82-65.1)^2 + (118-82)^2}, \sqrt{(98-98)^2 + (128-111.48)^2 + (148-128)^2}\right)
\]
\[= (\langle 39.88, 25.94 \rangle)
\]

Step 4: Decide the shortest path with the path having lowest Euclidean distance for member and non member by examining the Euclidean distance $d$ between $L_{\text{Min}}$ and $d_i$ for $i = 1,2,3,4$.

From the above calculations we can see that Path (4) $1\rightarrow 3\rightarrow 5\rightarrow 6$ has the least Euclidean distance for membership and non membership. The shortest path from source node 1 to destination node 6 is $1\rightarrow 3\rightarrow 5\rightarrow 6$.
