Abstract

Description of integrated mode profile by determine of $\kappa$, $\gamma$, $\delta$ parameters as functions of the propagation constant ($\beta$) and effective refractive index ($n_{\text{eff}}$). The profile can be seen from $E(x)$ formula for each guide TE (Transverse Electric) modes. Assumptions given in this slab waveguide is used for wavelength ($\lambda$) 1.55 $\mu$m, the thickness ($d$) of the core is 0.9 $\mu$m with a type of symmetric step-index slab waveguide, refractive index of $n_1$ is 3.5 and refractive index of $n_2$ is 3, also $n_3=n_1$. The results of analysis are presented in graphical form by combining TE$_0$ mode, TE$_1$ mode and TE$_2$ mode.

Keywords: Propagation constant, effective refractive index, slab waveguide, symmetric waveguide.

1 Introduction

The analysis of TE modes are started with the electric field polarized along y direction for a symmetric step index slab waveguide. This calculation is performed to determine the profile mode slab waveguides, and prove the characteristics of the TE mode that $n_2 > n_3$, $n_1 = n_3$ and the number of frequency normalization. A schematic diagram of a model for an symmetric slab waveguide is shown in Fig 1. The refractive index indices of the guiding layer, substrate and cover are $n_g$, $n_s$ and $n_c$ respectively. It’s assumed that the refractive index of the substrate is greater than the cover.

![Fig 1. A schematic of a symmetric step-index slab waveguide[1].](image_url)

Depending on whether a total internal reflection occurs at the core-substrate or/and core-cover interfaces, there are at least three types of modes that may be supported by waveguide. They are guided modes, substrate radiation modes and superstrate-cover radiation modes as indicated in Fig 2 below.
Analysis of TE (transverse electric) modes

In Fig 2(a) shows that the light beams coming from substrate layer to guiding layer will occur light beams that came out on the cover layer, this incident is known as radiation modes [1]. In Fig 2(b) equal to 2(a), for this case, the incident light angle vanishingly small, or better known as leaky modes. In Fig 2 (c) shows that the light beam total internal reflection occurs. Text of section 1.

2 Basic Theory

From Fig 1 and Fig 3, there are electric field (E) and magnetic field (H). Two field of type can performed into two Equations [2],

\[ \overline{E} = iE_x + jE_y + kE_z \]  \hspace{1cm} (1)\]

and

\[ \overline{H} = iH_x + jH_y + kH_z \]  \hspace{1cm} (2)\]

From Maxwell Equation, that;

\[ \nabla \times \overline{E} = -\mu \frac{\partial \overline{H}}{\partial t} \]  \hspace{1cm} (3)\]

Equation (3) can be expanded into [2],
\[
\begin{bmatrix}
i & j & k
\end{bmatrix}
\begin{bmatrix}
\frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z}
\end{bmatrix}
\begin{bmatrix}
E_x \\
E_y \\
E_z
\end{bmatrix}
= -\mu \frac{\partial}{\partial t} \left[ iH_x + jH_y + kH_z \right]
\]

then,
\[
i \left[ \frac{\partial E_y}{\partial y} - \frac{\partial E_x}{\partial z} \right] - j \left[ \frac{\partial E_x}{\partial x} - \frac{\partial E_y}{\partial z} \right] + k \left[ \frac{\partial E_x}{\partial x} - \frac{\partial E_y}{\partial z} \right]
= i \left[ -\mu \frac{\partial E_y}{\partial t} \right] + j \left[ -\mu \frac{\partial E_x}{\partial t} \right] + k \left[ -\mu \frac{\partial E_x}{\partial t} \right]
\] (4)

Condition for slab waveguide is \( \frac{\partial}{\partial y} = 0 \); therefore Equation (4) becomes [3],
\[
\begin{align*}
\frac{\partial E_y}{\partial z} &= \mu \frac{\partial H_x}{\partial t} \quad (5) \\
\frac{\partial E_x}{\partial x} - \frac{\partial E_z}{\partial z} &= \mu \frac{\partial H_y}{\partial t} \quad (6) \\
\frac{\partial E_y}{\partial x} &= -\mu \frac{\partial H_z}{\partial t} \quad (7)
\end{align*}
\]

As explained in Equation (3), by using Maxwell Equation below;
\[
\nabla \times \overrightarrow{H} = \frac{\partial \overrightarrow{E}}{\partial t} = \varepsilon_0 n^2 \frac{\partial \overrightarrow{E}}{\partial t}
\] (8)

from Equation (8) above, it is expanded into,
\[
\begin{bmatrix}
i & j & k
\end{bmatrix}
\begin{bmatrix}
\frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z}
\end{bmatrix}
\begin{bmatrix}
H_x \\
H_y \\
H_z
\end{bmatrix}
= -\varepsilon_0 n^2 \frac{\partial}{\partial t} \left[ iE_x + jE_y + kE_z \right]
\]

\[
i \left[ \frac{\partial H_y}{\partial y} - \frac{\partial H_x}{\partial z} \right] - j \left[ \frac{\partial H_x}{\partial x} - \frac{\partial H_y}{\partial z} \right] + k \left[ \frac{\partial H_x}{\partial x} - \frac{\partial H_y}{\partial z} \right]
= i \left[ \varepsilon_0 n^2 \frac{\partial E_x}{\partial t} \right] + j \left[ \varepsilon_0 n^2 \frac{\partial E_y}{\partial t} \right] + k \left[ \varepsilon_0 n^2 \frac{\partial E_x}{\partial t} \right]
\] (9)

then, it shows that,
\[
-\frac{\partial H_y}{\partial z} = \varepsilon_0 n^2 \frac{\partial E_x}{\partial t}
\] (10)
Analysis of TE (transverse electric) modes

\[
\frac{\partial H_y}{\partial z} - \frac{\partial H_z}{\partial x} = \varepsilon_0 n^2 \frac{\partial E_y}{\partial t} \tag{11}
\]
\[
\frac{\partial H_y}{\partial x} = \varepsilon_0 n^2 \frac{\partial E_z}{\partial t} \tag{12}
\]

3 TE (Transverse Electric) Mode

![Fig 3. TE mode polarization [3.]](image)

Assume that is based on physical condition [1-4]

\[
E_y = E_{y0} e^{j(\omega t - \beta z)} \tag{13}
\]
\[
H_x = H_{x0} e^{j(\omega t - \beta z)} \tag{14}
\]
\[
H_z = H_{z0} e^{j(\omega t - \beta z)} \tag{15}
\]

From Equations (13), (14) and (15). They can be performed using differential Equation,

\[
\frac{\partial E_y}{\partial t} = j \omega \quad \text{and} \quad \frac{\partial E_z}{\partial t} = -j \beta
\]
\[
\frac{\partial H_x}{\partial t} = j \omega \quad \text{and} \quad \frac{\partial H_z}{\partial t} = -j \beta, \text{ also}
\]
\[
\frac{\partial H_z}{\partial z} = j \omega \quad \text{and} \quad \frac{\partial H_x}{\partial z} = -j \beta
\]

Main fields that worked in TE mode are \( E_y \), \( H_x \), and \( H_z \) field. Therefore, Equation (5), (7) and (11) can be simplified into,

\[
-j \beta E_y = j \omega \mu H_x \tag{16}
\]
\[
\frac{\partial E_y}{\partial x} = -j \omega \mu H_z \tag{17}
\]
\[
-j \beta H_x - \frac{\partial H_z}{\partial x} = j \omega \varepsilon_0 n^2 E_y \tag{18}
\]

If Equations (16) and (17) are substituted into Equation (18), they can performed [3],
\[
\frac{\partial^2 E_y}{\partial x^2} + \left( k^2 n^2 - \beta \right) E_y = 0
\]  
(19)

where,  \( k = \frac{\omega}{c} = \frac{\omega}{\sqrt{\mu_0 \varepsilon_0}} \)

\( k \) is free space wave number.
\( \beta \) is called the propagation constant.
\( n \) is called material refractive index.

Solution of differential Equation orde-2 of Equation (19) is

\[
E_y = E_{y01} e^{\left( \sqrt{k^2 n^2 - \beta^2} \right) x} + E_{y02} e^{\left( -\sqrt{k^2 n^2 - \beta^2} \right) x}
\]  
(20)

or

\[
E_y = A \cos\left( \sqrt{k^2 n^2 - \beta^2} \right) x + B \cos\left( \sqrt{k^2 n^2 - \beta^2} \right) x
\]  
(21)

i. For area \( n_{eff} = n_1 \) or cladding (superstrate) [4-9]:

Equation (20) can be changed to be:

\[
E_y = E_{y01} e^{\left( \sqrt{k^2 n_1^2 - \beta^2} \right) x} + E_{y02} e^{\left( -\sqrt{k^2 n_1^2 - \beta^2} \right) x}
\]

from physical behavior is known that \( E_y \rightarrow 0 \) ; for \( x \rightarrow \infty \). So, \( k^2 n_1^2 - \beta^2 < 0 \)

Solution of Equation can be

\[
E_y = E_{y01} e^{-\delta x}
\]  
(22)

where,

\[
E_{y0} = E_{y01} + E_{y02}
\]

\[\delta = \sqrt{\beta^2 - k^2 n_1^2}\]  
(23)

\( \delta \) is a positive real number.

ii. For area \( n_{eff} = n_2 \) or guiding (core) [4-9]:

Equation (20) can be changed to be:

\[
E_y = E_{y01} e^{\left( \sqrt{k^2 n_2^2 - \beta^2} \right) x} + E_{y02} e^{\left( -\sqrt{k^2 n_2^2 - \beta^2} \right) x}
\]

or

\[
E_y = A \cos\left( x\sqrt{k^2 n_2^2 - \beta^2} \right) + B \sin\left( x\sqrt{k^2 n_2^2 - \beta^2} \right)
\]

Solution of Equation above to be,

\[
E_y = E_{y01} e^{i\kappa x} + E_{y02} e^{-i\kappa x}
\]  
(24)

or

\[
E_y = A \cos(\kappa x) + B \sin(\kappa x)
\]  
(25)
Analysis of TE (transverse electric) modes

where

\[ \kappa = \sqrt{k^2 n_2^2 - \beta^2} \]  \hspace{1cm} (26)

\( \kappa \) is a real number.

iii. For area \( n_{\text{eff}} = n_3 \) or substrate [4-9]:

Equation (20) can changed to be:

\[
E_y = E_{y031} e^{\left(\sqrt{k^2 n_3^2 - \beta^2}\right)x} + E_{y032} e^{\left(\sqrt{k^2 n_3^2 - \beta^2}\right)x}
\]  \hspace{1cm} (27)

from physical behavior is known that \( E_y \to 0 \); for \( x \to \infty \). So,

\[ k^2 n_3^2 - \beta^2 < 0 \]

Solution of Equation to be

\[ E_y = E_{y03} e^{\gamma x} \]  \hspace{1cm} (28)

Where,

\[ \gamma = \sqrt{\beta^2 - k^2 n_3^2} \]  \hspace{1cm} (29)

\( \gamma \) is a real number.

4 Calculation and Results

The assumption of this case is the wavelength (\( \lambda \)) 1.55 \( \text{m} \). Refractive index of guided layer (\( n_2 \)) is 3.5 and refractive index of substrate layer (\( n_3 \)) and cover layer (\( n_1 \)) are 3.00. In the Fig 4 shows that the frequency of normalization or \( V \)-parameter obtained is [7-11]

\[ V = 2\pi \left( \frac{d}{\lambda} \right) \sqrt{n_1^2 - n_2^2} \]  \hspace{1cm} (30)

\[ V = 3.289 \]

The value above is obtained from \( d = 0.45 \). In Fig 4 below, \( V \) - value of is shown on the dashed line.
In the Fig 4 above showed that the solid line represent the graph of the even - TE modes and the dash-dot line represent the graph of the odd - TE modes [12]. Based on the Fig 4, the first confined mode is identified to be at the value of $\kappa d \leq 1.198$ while the second confined mode is identified to be in the range of $2.34693 < \kappa d \leq 3.26396$.

Basically at the specific value of confined mode ($\kappa d$), the parameters of the equation could be defined by with the value below using the above.

**Table 1. Confined mode calculation.**

Analysis of TE (transverse electric) modes

Fig 5. Mode profile for TE\(_0\), TE\(_1\) dan TE\(_2\).

In the Fig 5 shows the mode profile in the slab waveguide. Profile is obtained from the Equation \(E_y(x)\) on the ordinate axis and the waveguide layer \(x_1\) (substrate), \(x_2\) (guided) and \(x_3\) (cover) on the abscissa axis. TE\(_0\) values that must be met are:

\[
0 = \frac{d}{\kappa} \tan \left( \frac{\pi V}{\kappa d_0} \right) \quad \text{(31)}
\]

where \(\kappa_0\) is 1.3, then the angle of \(\kappa d_0\) is 1.1980\(^0\).

\[
k_0 = \frac{\kappa d_0}{d} = 2.662.
\]

The results above will be used to determine the propagation constants, namely:

\[
\beta_0 = \sqrt{\left( \frac{2\pi}{\lambda} \right)^2 n_1^2 - \left( \frac{\kappa d_0}{d} \right)^2} \quad \text{(32)}
\]
\[ \gamma_0 = \sqrt{\beta_0^2 - \left(\frac{2\pi}{\lambda}\right)^2 n_2^2} \]  

Equation (32) and (33) will yield a value of \( \beta_0 = 13.936 \) and \( \gamma_0 = 6.806 \). From Equation (34), will get the value of effective refractive index \( (n_{eff,0}) \),

\[ n_{eff,0} = \frac{\beta_0 \lambda}{2\pi} \]

For TE1 values that must be met are:

\[ \cot(\kappa d_1) = -\frac{\sqrt{V^2 - \kappa d_1}}{\kappa d_1} \]  

Same as the above case \( \kappa d_1 = 2.00 \), then the angle of \( \kappa d_1 \) is 2.347\(^0\). For the value \( k_1 = 5.215 \), \( \beta_1 = 13.195 \), \( \gamma_1 = 5.119 \) and \( n_{eff,1} = 3.255 \). For TE2 values that must be met are:

\[ \tan(\kappa d_2) = -\frac{\sqrt{V^2 - \kappa d_2}}{\kappa d_2} \]  

for \( \kappa d_2 = 3.00 \), then the angle of \( \kappa d_2 = 3.264\(^0\) \). Therefore \( k_2 = 7.253 \), \( \beta_2 = 12.194 \), \( \gamma_2 = 0.892 \) and \( n_{eff,2} = 3.008 \).

5 Conclusion

We found that the mode profiles is shown by TE0 TE1 and TE2. \( V \)-parameter or normalized frequency is 3.289. Boundary condition of mode value on the each layer are \(-0.9 \leq x_1 < -0.45 \) for substrate layer, \(-0.45 \leq x_2 \leq 0.45 \) for guided layer and \( 0.45 < x_3 \leq 0.9 \) for cover layer. TE0 TE1 and TE2 as the mode profile that was calculated. Simulated quantization value is 0.01. Effective refraction index of material on substrate layer \( (n_{eff,0}) \) is 3.438 for TE0, effective refractive index on guided layer \( (n_{eff,1}) \) is 3.255 for TE1 and effective refractive index on cover layer \( (n_{eff,2}) \) is 3.008 for TE2.

A. 1. Slab – Waveguide Analysis

We assumed that cladding $\gg 2a$, with $x_2$ and $x_3$ is the width and length of the slab-waveguide. The two conditions for wave to propagate are :

1. $\gamma^2 > 0$ shows that wave propagate through the core.
2. $\gamma^2 < 0$ shows that there is no wave propagation through the cladding.
Continuity boundary condition,
\[ \hat{n} \times \hat{E}_1 = \hat{n} \times \hat{E}_2 \]  
with the time and \( x_3 \) dependence
\[ e^{i(\alpha x - \beta x_3)} \]  
The component \( E_y \) is obtained as solution of the reduce wave equation \[13\]
\[ \frac{\partial^2 E_y}{\partial x^2} + a^2 = 0 \]  
where,
\[ a > 0, \quad E_y = A \cos(ax) + B \sin(ax) \]  
\[ a < 0, \quad E_y = A e^{ax} \]  
For TE mode can be written wave equation,
\[ E(x_1, x_2, x_3, t) = \gamma E(x_1, x_2) e^{i(\alpha x - \beta x_3)} \]  
\( E \) in direction of \( x_2 \) is unlimited uniform value, \( E \) is only vary with \( x \) and is expressed as;
\[ \left( \frac{\partial^2}{\partial x^2} + \gamma^2 \right) E(x_1) = 0 \]  
therefore the solution of Eigen value can be written as :
core :
\[ E_1(x_1) = A \cos(\gamma x_1) + B \sin(\gamma x_1), -a \leq x_1 \leq a \]  
cladding:
\[ E_2(x_1) = c e^{(-ax_1)} \]  
\[ E_2(x_1) = d e^{(ax_1)} \]  
with,
core :
\[ \gamma^2 = k_1^2 - \beta^2 = \omega^2 \mu_1 \varepsilon_1 - \beta^2 = n_1^2 k_0^2 - \beta^2 \]  
Cladding:
\[ \alpha^2 = \beta^2 - k_2^2 = \beta^2 - \omega^2 \mu_2 \varepsilon_2 = \beta^2 - n_2^2 k_0^2 \]  
Boundary condition \( x = a \)
Continuity equation is \( E_1(x_1) = E_2(x_1) \), then
\[ A \cos(\gamma a) + B \sin(\gamma a) = c e^{(-a \alpha a)} \]  
if
\[ \frac{\partial E_1(x_1)}{\partial x_1} = \frac{\partial E_2(x_1)}{\partial x_1} \]  
then
\[ -\gamma A \sin(\gamma a) + \gamma B \cos(\gamma a) = -\alpha c e^{(-a \alpha a)} \]  
Boundary condition \( x = -a \)
Continuity equation is \( E_1(x_1) = E_2(x_1) \), then
Analysis of TE (transverse electric) modes

\[ A \cos(j) - B \sin(j) = d e^{(-\alpha x)} \]  
\[ \frac{\partial E_1(x_1)}{\partial x_1} = \frac{\partial E_2(x_1)}{\partial x_1} \]

then

\[ \gamma A \sin(j) + \gamma B \cos(j) = -\alpha d e^{(-\alpha x)} \]  
Substitute eq (a. 14) and (a. 17),

\[ A \cos(j) + B \sin(j) = c e^{(-\alpha x)} \]

\[ A \cos(j) - B \sin(j) = d e^{(-\alpha x)} \]

Adding above equation,

\[ 2A \cos(j) = (c + d) e^{(-\alpha x)} \]  
Substitute eq (a. 16) and (a. 18),

\[ -\gamma A \sin(j) + \gamma B \cos(j) = -\alpha c e^{(-\alpha x)} \]

\[ \gamma A \sin(j) + \gamma B \cos(j) = -\alpha d e^{(-\alpha x)} \]

Subtracting above equation,

\[ 2\gamma A \sin(j) = \alpha (c + d) e^{(-\alpha x)} \]  
We can divide eq (a. 20) and (a.19)

\[ \frac{2\gamma A \sin(j)}{2A \cos(j)} = \frac{\alpha (c + d) e^{(-\alpha x)}}{(c + d) e^{(-\alpha x)}} \]

then,

\[ \tan(j) = \frac{\alpha}{\gamma} \]  

where \( a = \frac{h}{2} \)

In complete equation can be written,

\[ \tan \left( \left( n_1^2 k_0^2 - n_{\text{eff}}^2 k_0^2 \right) \frac{h}{2} \right) = \frac{n_{\text{eff}} k_0^2 - n_2^2 k_0^2}{n_1^2 k_0^2 - n_{\text{eff}}^2 k_0^2} = 0 \]

using the numerical method of the equation above, the effective value of refractive index could be determined.
